

APPENDIX

1

EP-1 041 025 A is commented on in the application text,
p. 3, ll. 1-9.

In DE-42 33 521 A1 an adhesive tape is described with an
inner adhesive surface and an outer adhesive surface which
5 consists of two parallel strips separated by a gap. After
lifting of a section of the web adjacent to its end the
inner adhesive surface of the tape is pressed against the
next-inner layer of the reel. Then the web section is
returned to its original position and a strip immediately
10 adjacent to the web end pressed against one of the adhesive
strips constituting the outer adhesive surface while the
other strip remains free.
